

Write the name of your endangered animal below.

Fact File -Polar Bear

Fact File by -<https://www.ecology.com/environment/nature/polar-bear-description>

	Where can you find it?
	Polar bears occur throughout the Arctic, in the northern hemisphere.
	What kind of habitat does it live in?
	This bear species lives in an aquatic terrestrial environment.
	What does it eat?
The food of polar bears are seals and reindeer, songs, hares, birds, fish.	
	The polar bear is one of the largest land predators in the World

How would you describe your endangered animal?

The polar bear, the white bear is a predator from the bear family with a white or cream fur. has a longer neck, more elongated torso than the other bears, fingers half-skinned. The feet are hairy, which protects him from the cold. Is the target of hunting Eskimos. His fur and fat are valued. He is the undisputed ruler of eternal ice cream. Goes on a long journey. Swims and dives perfectly. The weight of a polar bear is from 400kg up to one ton. Body length is from 220 to 250 cm.

How many of them are left in the world?

The total number of polar bears is estimated at 25,000 - 26,000 in the World.

Why are they endangered? What is happening to them?

Because of the lack of ice, white bears have nothing to eat. To hunt effectively, animals need a large ice floe in which they catch seals. Melting ice makes seals out of reach of bears. Due to climate change, the protection of this species seems very problematic.

What can humans do to stop them from becoming extinct?

The most important step to protect a polar bear is to act decisively to stop Arctic warming. To save the Arctic, international cooperation is needed to reduce greenhouse gas emissions from soot and methane.
